

phpMyFAQ 2.6

Add a page using the PMF Template framework

It's easy:

1. Build a template file and call it e.g. **test.tpl** and place it in the template/ folder:

```
<!-- Start Test Content -->
<h2>{testTitle}</h2>
<span>{testContent}</span>
<!-- End Test Content -->
```

2. Build a PHP file called e.g. **test.php** (the base name must match with that of the template file) and save it in the root of phpMyFAQ:

```
' ;
}

$tpl->processTemplate ('writeContent', array(
    'testTitle'      => $testTitle,
    'testContent'    => $testContent
));

$tpl->includeTemplate('writeContent', 'index');
?>
```

3. Register the variable e.g. "**test**" in inc/constants.php in the array **\$allowedVariables**;
4. Now you can access the new **test** page via **index.php?action=test**.
