

# phpMyFAQ 2.8

## Add a page using the PMF Template framework

It's easy:

1. Build a template file and call it e.g. **test.tpl** and place it in the *template/* folder:

```
<!-- Start Test Content -->
<h2>{testTitle}</h2>
<span>{testContent}</span>
<!-- End Test Content -->
```

2. Build a PHP file called e.g. **test.php** (the base name must match with that of the template file) and save it in the root of phpMyFAQ:

```
' ;
}

$tpl->parse ('writeContent', array(
                                'testTitle'    => $testTitle,
                                'testContent'  => $testContent
                                )
            );
$tpl->merge('writeContent', 'index');
?>
```

3. Register the variable e.g. "**test**" in *config/constants.php* in the array **\$allowedVariables**;
4. Now you can access the new **test** page via **index.php?action=test**.
