

# phpMyFAQ 2.7

## Add a page using the phpMyFAQ Template framework

It's easy:

1. Build a template file and call it e.g. **test.tpl** and place it in the template/ folder:

```
<!-- Start Test Content -->
<h2>{testTitle}</h2>
<span>{testContent}</span>
<!-- End Test Content -->
```

2. Build a PHP file called e.g. **test.php**(the base name must match with that of the template file) and save it in the root of phpMyFAQ:

```
<?php
$testTitle = 'My first PMF page';
$testContent = '';

for($i=0; $i<10; $i++) {
    $testContent .= 'Line '.$i.'  
';
}

$tpl->processTemplate ('writeContent', array(
    'testTitle'      => $testTitle,
    'testContent'    => $testContent
    )
);

$tpl->includeTemplate('writeContent', 'index');
?>
```

3. Register the variable e.g. "**test**" in config/constants.php in the array **\$allowedVariables**;
4. Now you can access the new **test** page via **index.php?action=test**.
